

Project Executable Files

Date	02 July 2026
Team ID	xxxxxx
Project Name	Rising waters
Maximum Marks	3 Marks

Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	Yes
5	Environment configuration file (.env.example or similar)	Yes
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	Yes
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

Flood Prediction/

```

|
|— dataset/
|   |— flood_dataset.xlsx
|
|— models/
|   |— flood_model.pkl
|
|— templates/
|   |— index.html
|
|— notebooks/
|   |— Flood_Prediction.ipynb
|
|— app.py
|— requirements.txt
|— README.md
  
```

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://rising-waters-project.onrender.com
Login Credentials (Demo)	Not required
Platform/Hosting Provider	IBM Cloud / Local Flask Server
Repository Link	https://github.com/Bhargavi11111/rising-waters-project-.git
Demo Video Link	https://drive.google.com/file/d/1duSAM5Ntp77OIiDIg75ZNRGyZRe9GgTP/view?usp=sharing

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

☐ Download or Clone the Repository

- Download the project as a ZIP file from GitHub and extract it, **or** clone it using:

```
git clone <repository_url>
```

☐ Install Python

- Install **Python 3.10 or later** from the official Python website if it is not already installed.

☐ Open the Project

- Open the project folder in **Visual Studio Code, PyCharm**, or any Python IDE of your choice.

☐ Install Required Dependencies

- Open a terminal in the project directory and run:

```
"pip install -r requirements.txt"
```

☐ Verify Project Files

- Ensure that the trained machine learning model file `flood_model.pkl` is available inside the `models` folder.
- Ensure that all project folders (`templates`, `dataset`, `models`, etc.) are present.

☐ Run the Flask Application

- Execute the following command:

```
"python app.py"
```

☐ Access the Web Application

- Once the application starts successfully, open your web browser and navigate to:

```
"http://127.0.0.1:5000"
```

☐ Test the Application

- Enter the required weather and rainfall parameters.
- Click **Predict Flood Risk**.
- The application will display the prediction result as either:
 - **Flood Risk Detected**, or
 - **No Flood Risk**.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Real-time weather data is not integrated.	Future enhancement using Weather API
2	IBM Cloud deployment is optional and may require additional configuration.	Can be deployed after project completion.
3	Prediction accuracy depends on the quality of historical weather data.	Improve the model by using larger and more diverse datasets.
